Healthcare Backend API — Testing Report

Prepared By: Neha Singh
Roll Number: 2315001455
Email: neha.singh_cs23@gla.ac.in

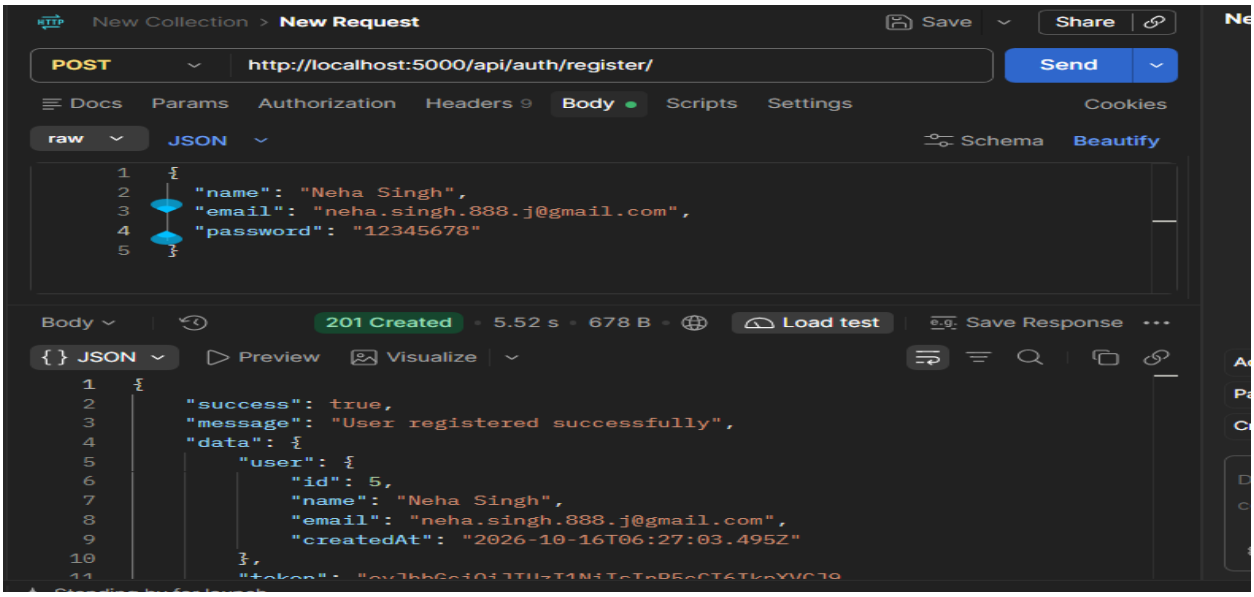

Technology Stack: Node.js, Express.js, PostgreSQL (Neon), Prisma ORM, JWT Authentication

Base URL: `http://localhost:5000`

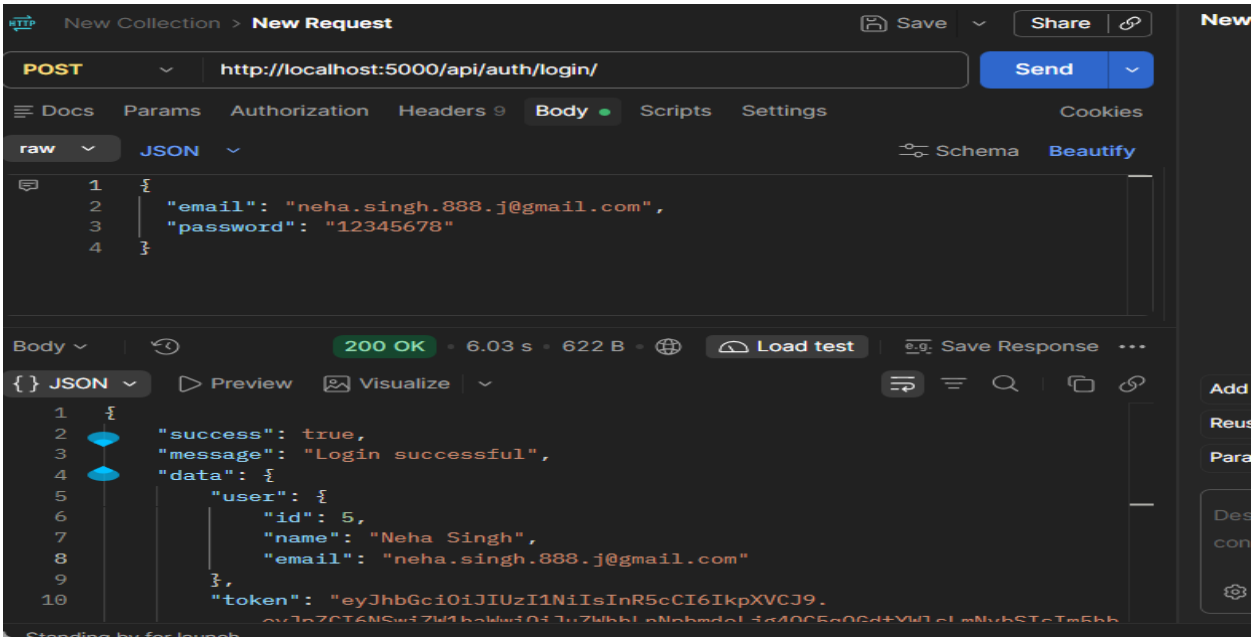

Introduction

The Healthcare Backend API is a RESTful backend application developed using Node.js, Express.js, PostgreSQL, and Prisma ORM. It provides APIs for user authentication, patient management, doctor management, and patient–doctor assignments.

Authentication Test Results

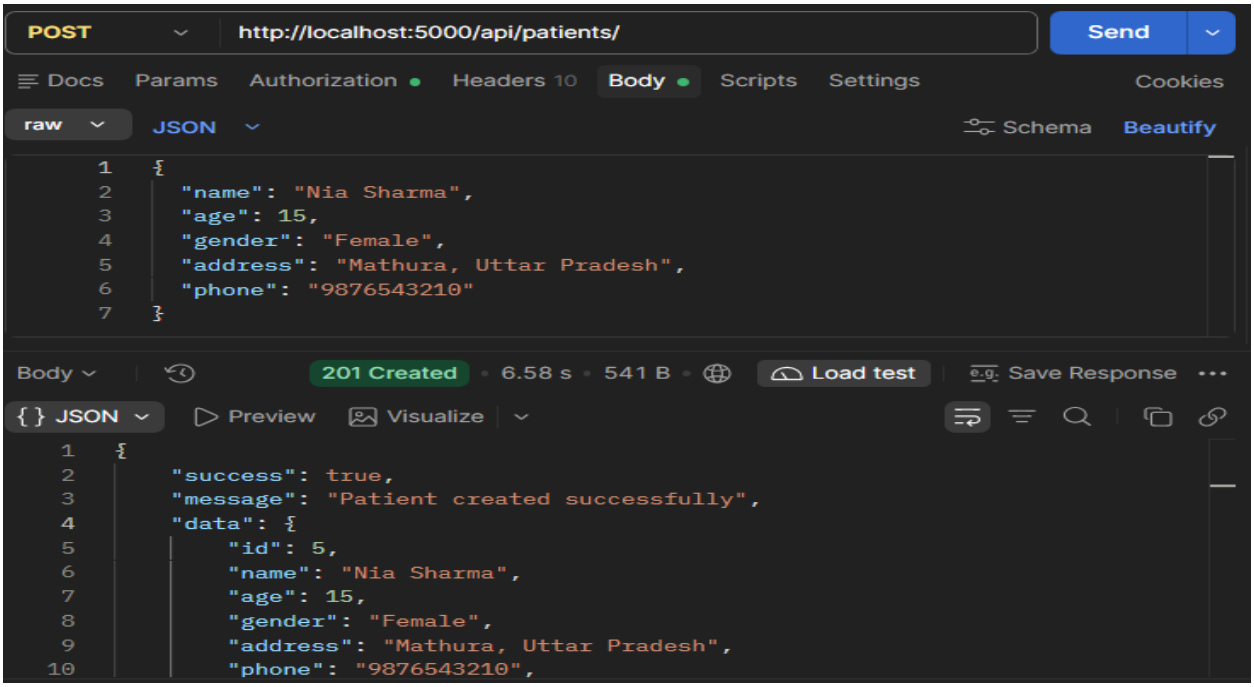

Login:

Patient API test results

Note: User should Provide Bearer token that he receive to authenticate valid user then only able to add patient

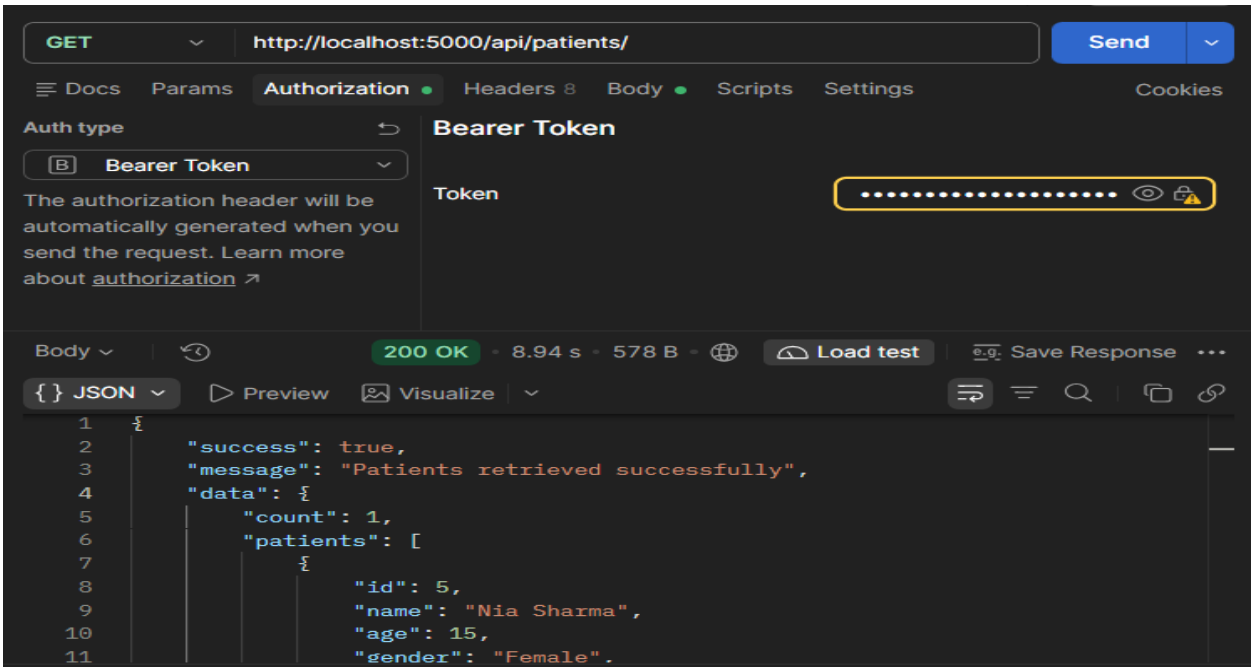

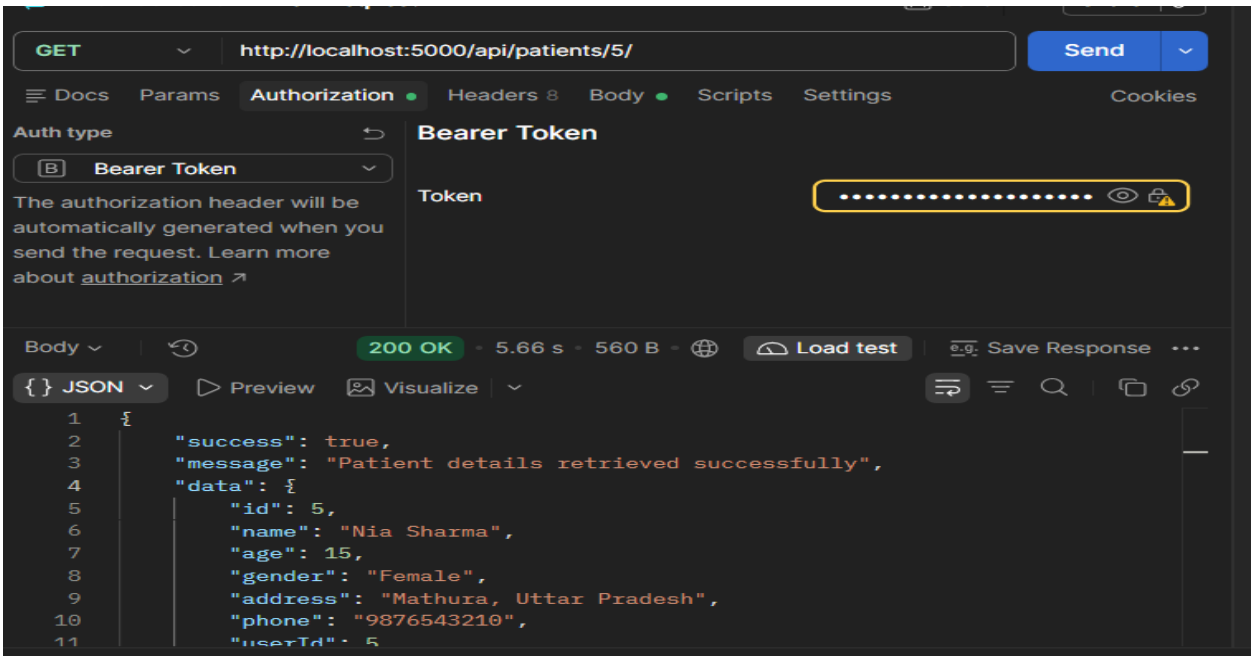

Retirve Patient :

API 5: Get a specific patient

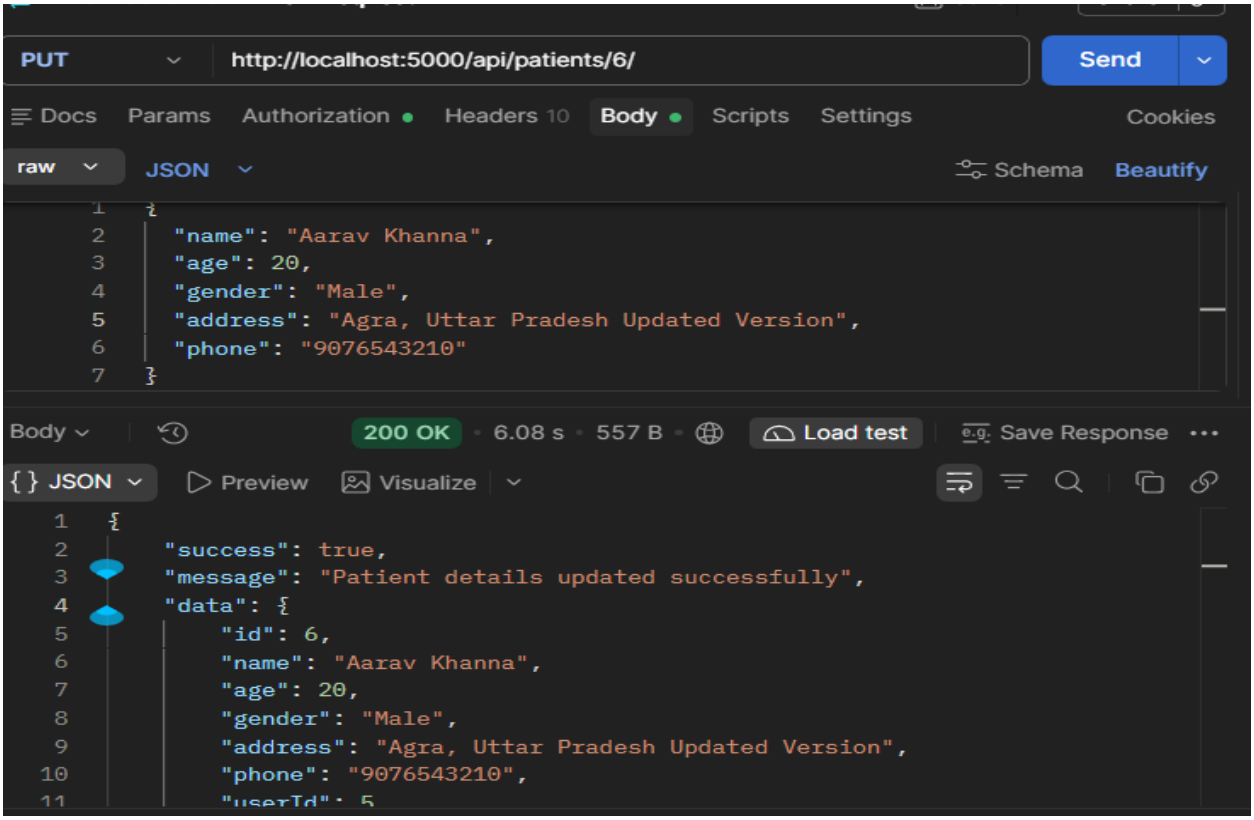

GET `http://localhost:5000/api/patients/1/`

- Body: None
- Authorization: Bearer Token

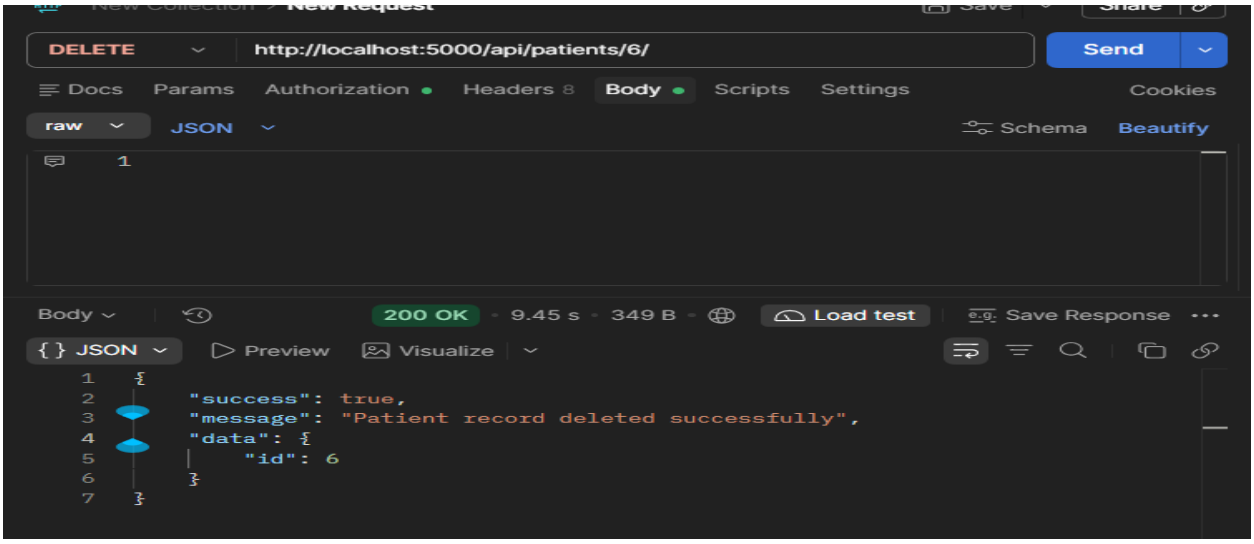

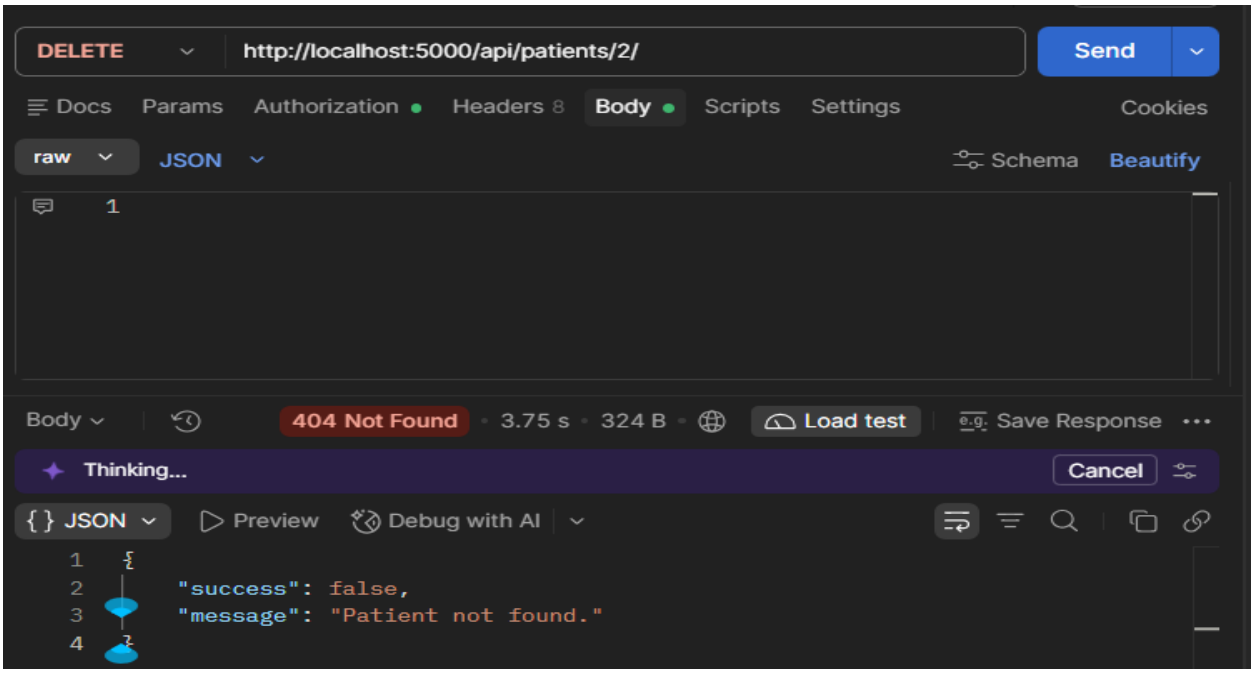

Update Patient Details:

Deletion Of patient:

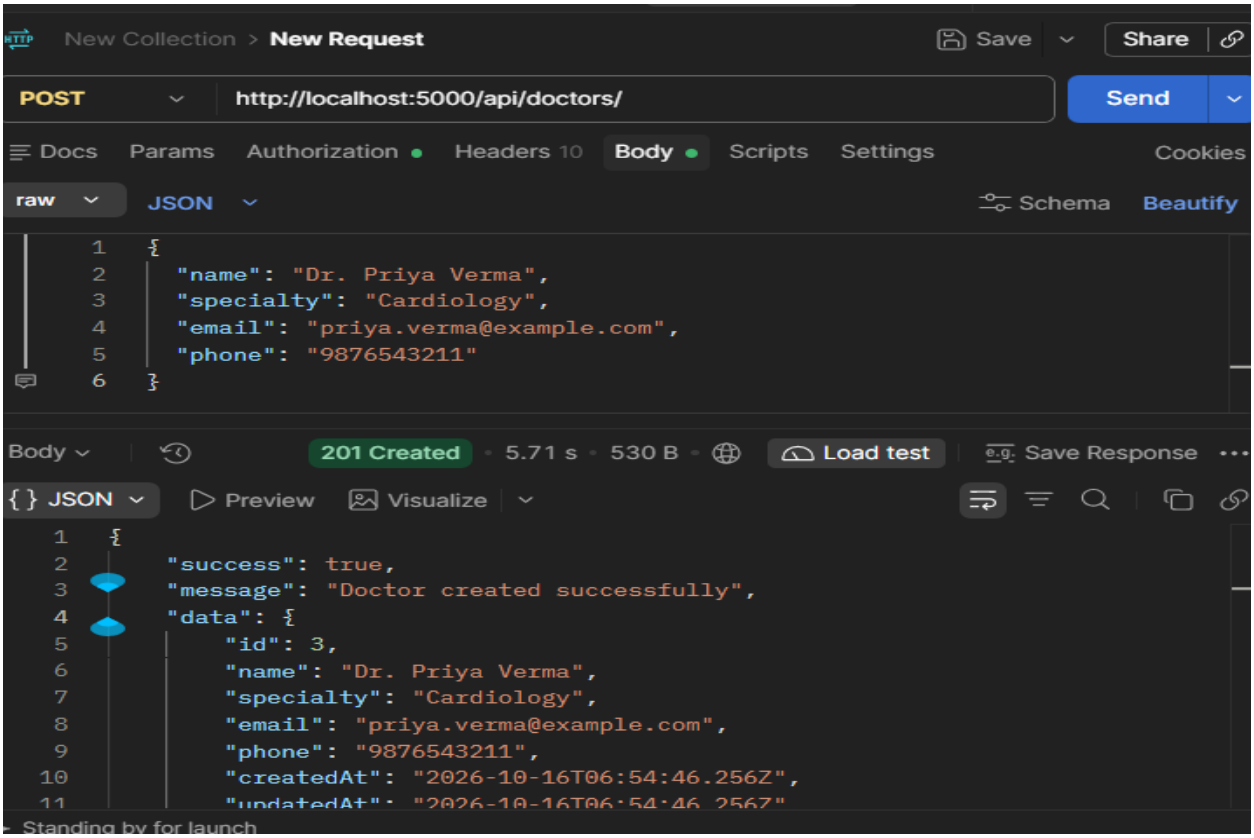

If patient not Existe with that id :

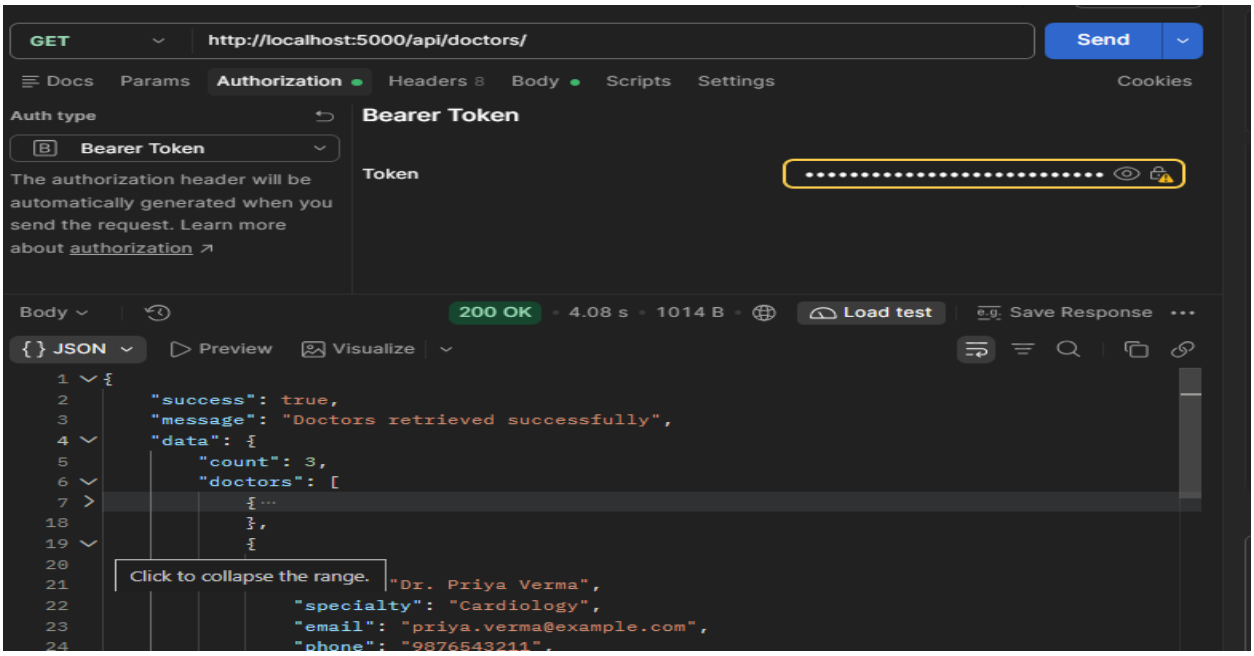

Doctor API test results

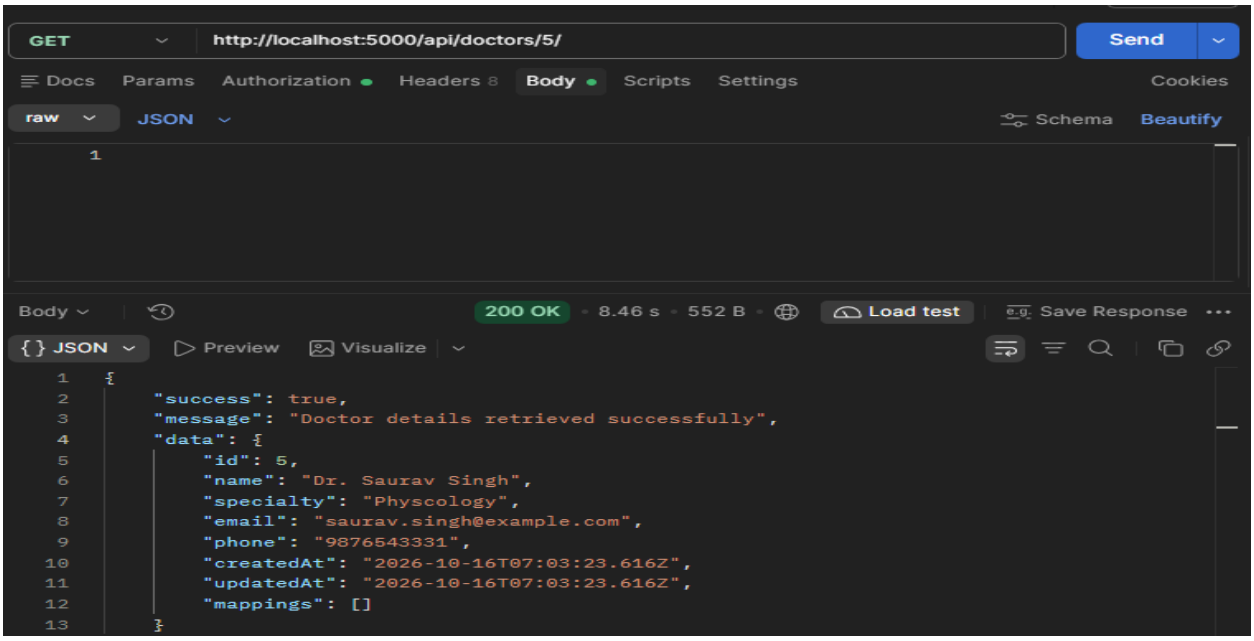

Adding Doctor:

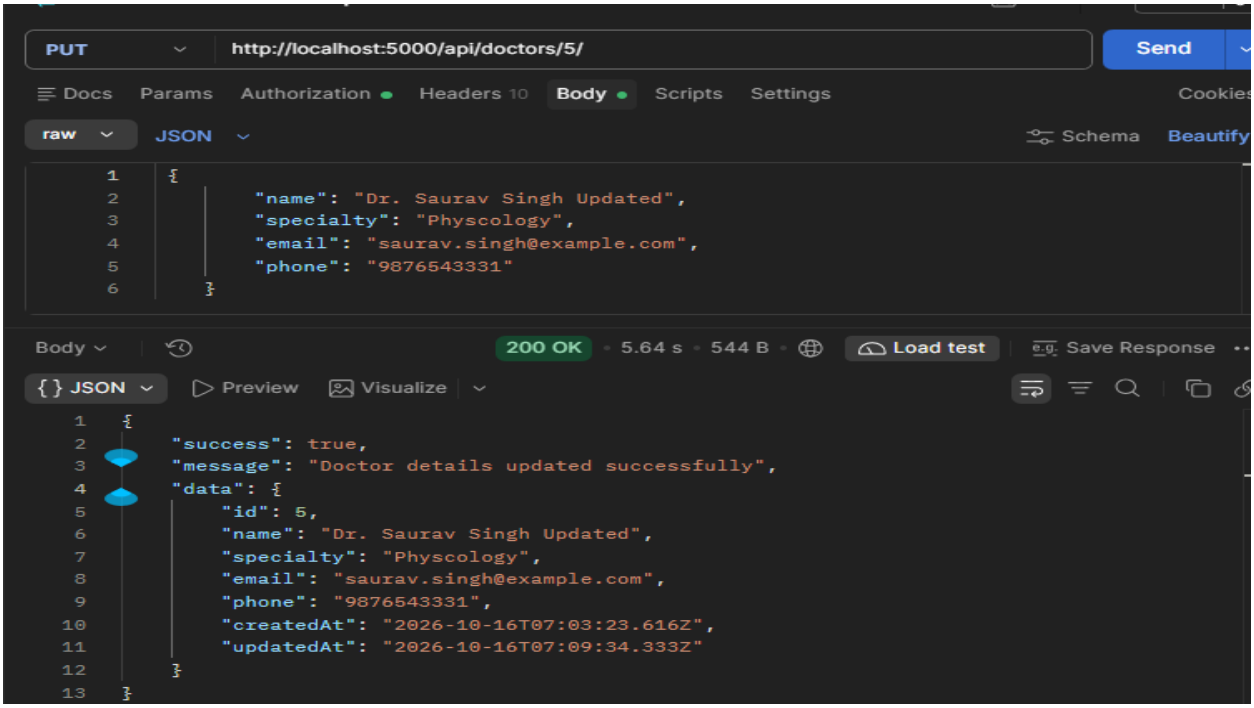

List of all Doctors Retrieval:

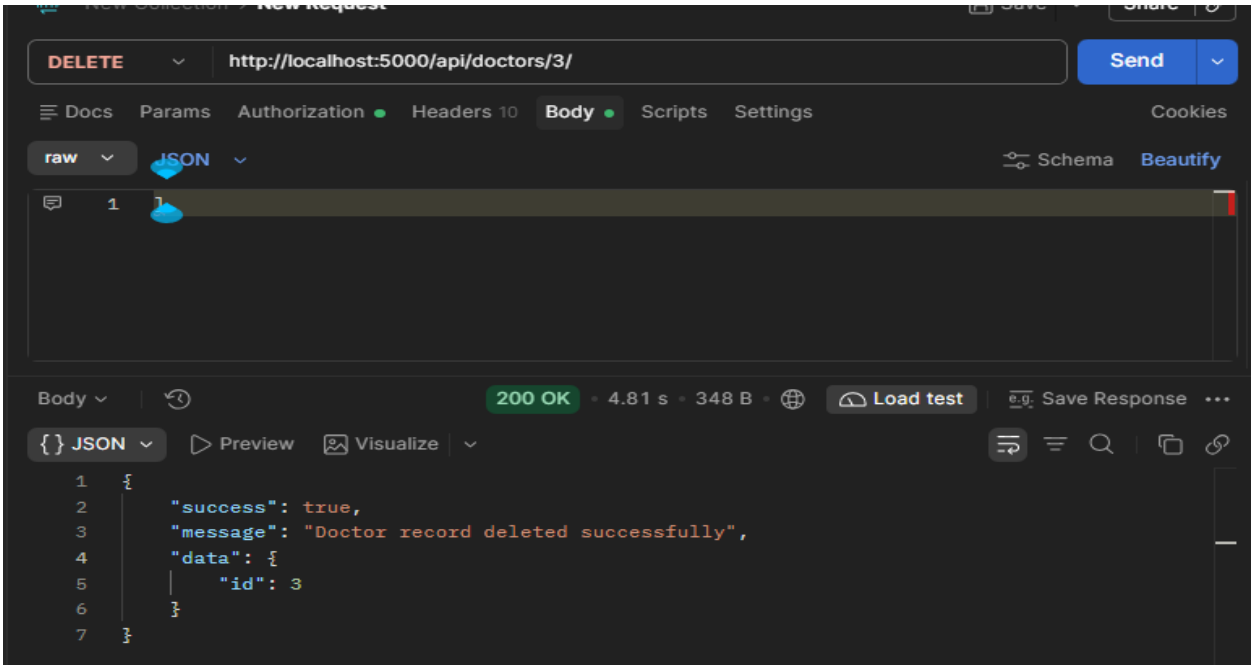

Getting Particular Doctor By id:

Doctor Updated Successfully:

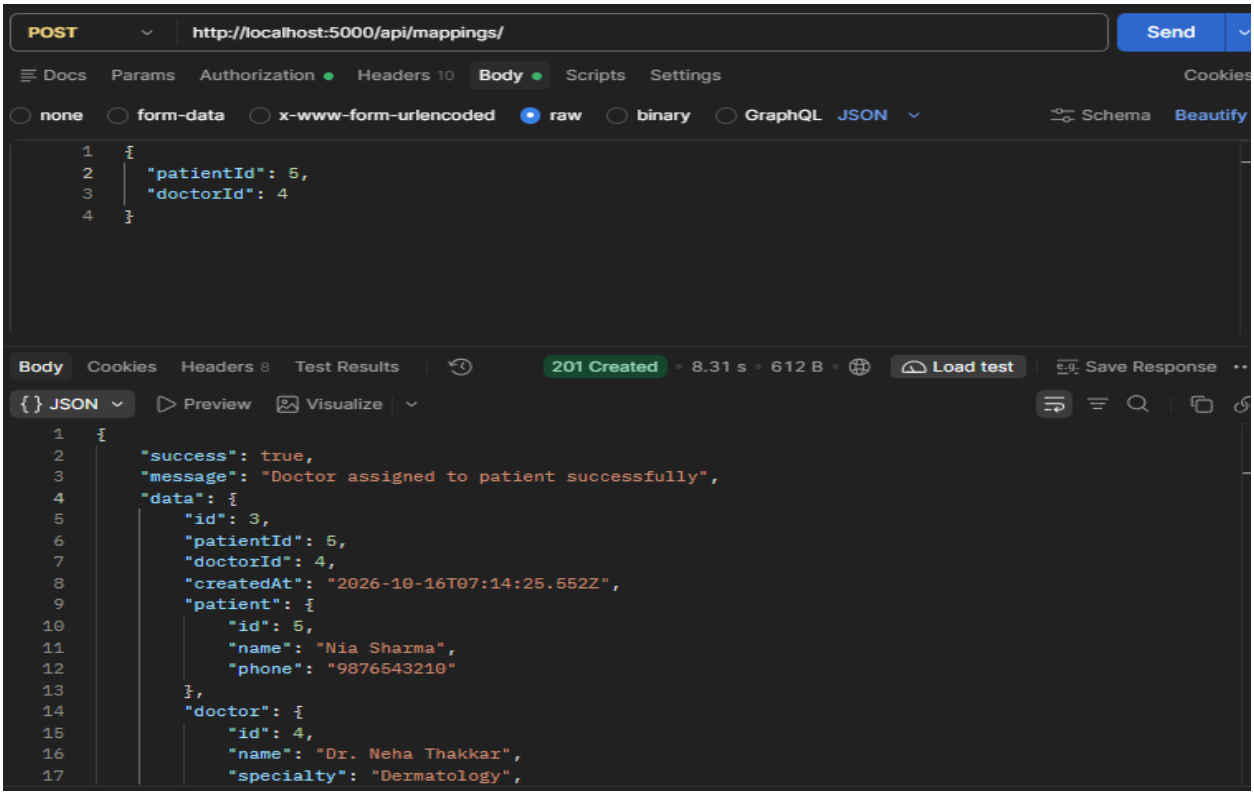

Deleting Doctor:

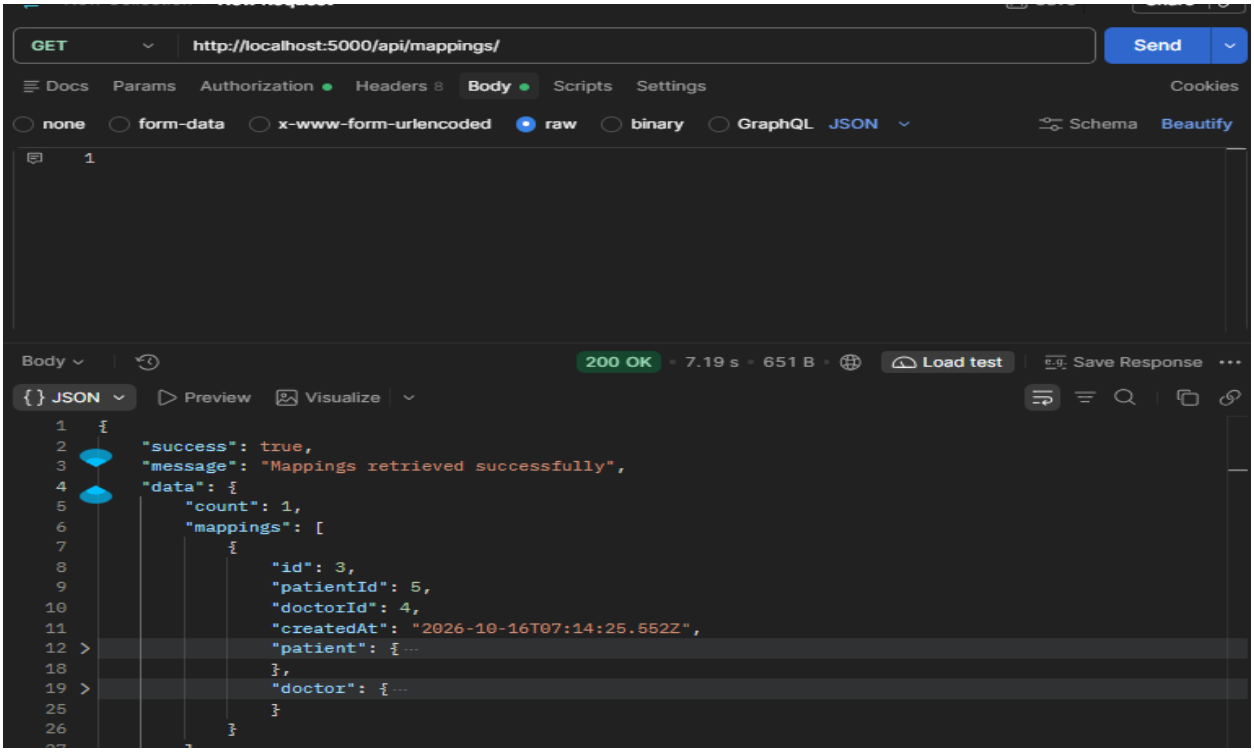

Patient-doctor mapping test results

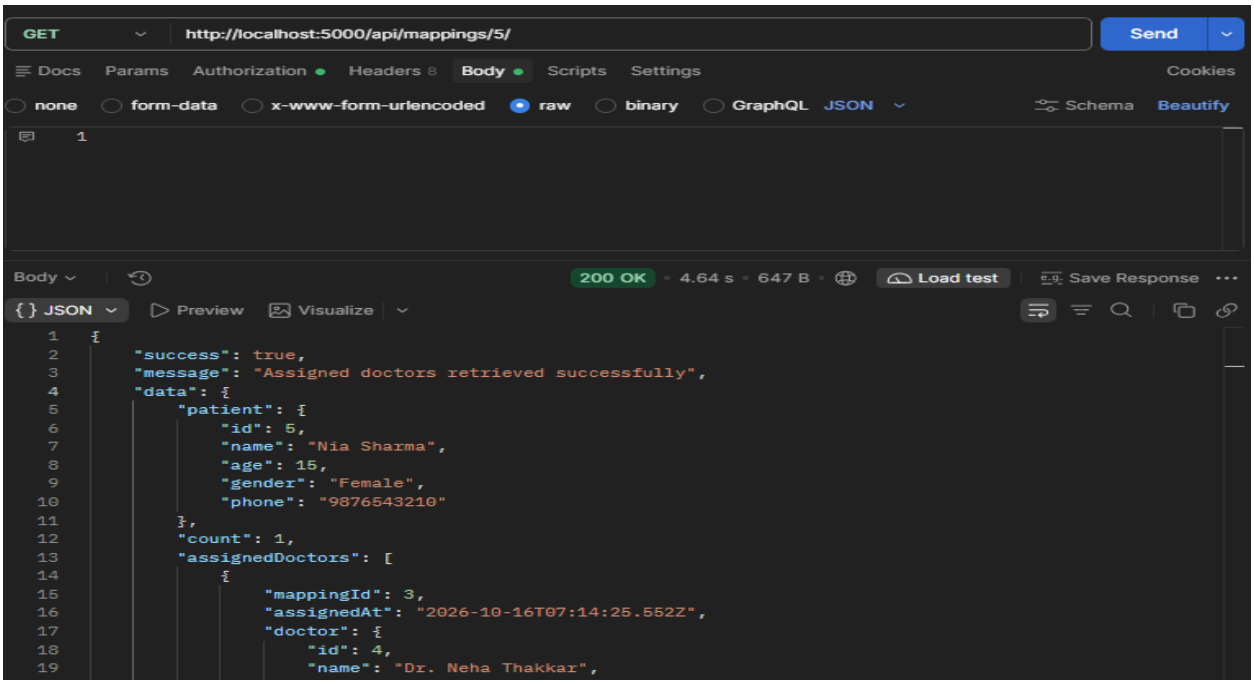

Mapping :

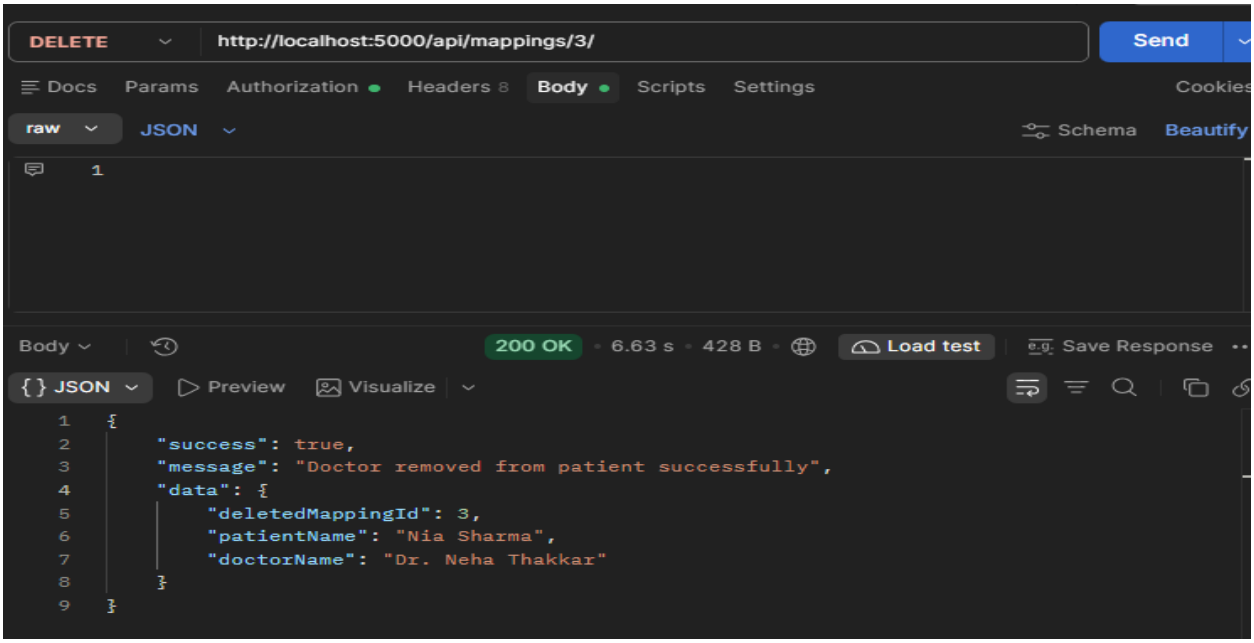

Get All Mappings:

Getting assigned doctors to particular patient:

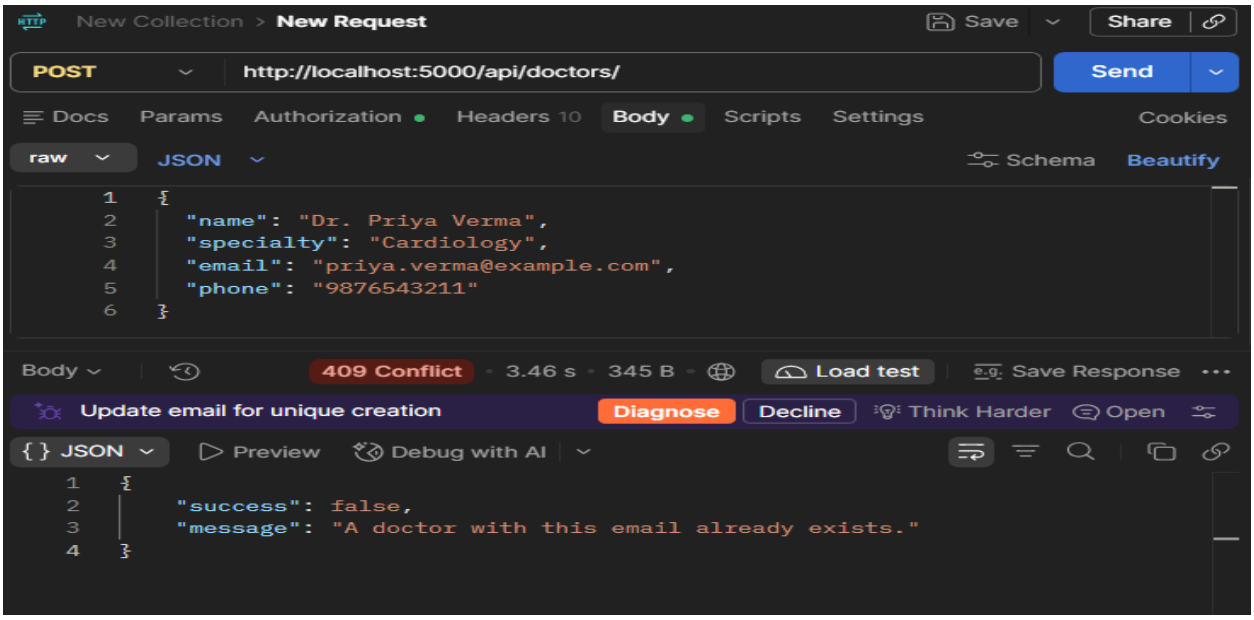

Delete Mapping:

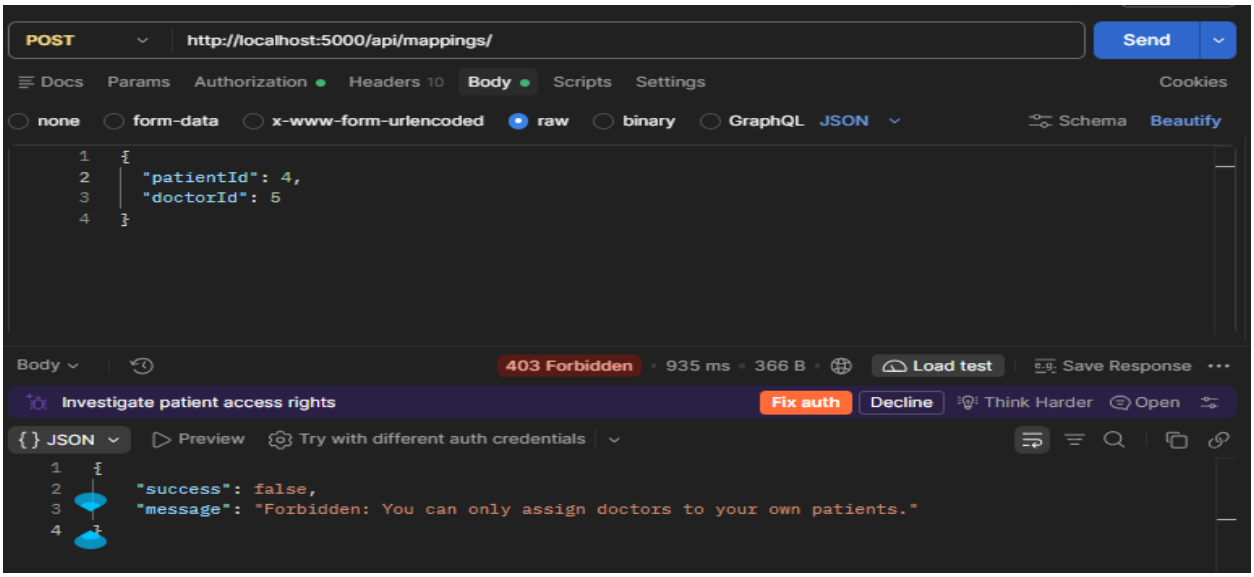

Validation and Error Handling

- Missing or invalid authentication tokens.
- Invalid email addresses and other invalid input data.
- Requests involving nonexistent patient, doctor, or mapping IDs.
- Duplicate or invalid patient–doctor assignments.
- Appropriate HTTP status codes and error messages.

Duplicate Emails check:

Vlidation of Tokens of authenticated user:

Conclusion

The Healthcare Backend API provides endpoints for authentication, patient and doctor management, and patient–doctor assignments. Postman is used to verify endpoint behavior, authentication, input validation, and error handling.
